

Efficient Long Distance Public Transport

Authors: Mitchell Jonker, Tyler Richardson, Noah Weyer, Ethan Strain

Problem Statement

The United States of America suffers from a lack of efficient public transport from state to state. Our solution is for the country to implement more high speed railroads, forming a nationwide network of high speed transport.

Who is experiencing the problem?

People who need to travel long distances for work, those who live in a city where a car is less practical, those who travel far often, and those who cannot afford a car.

What is the problem?

There is not a readily available method of public transport that travels long distances efficiently and in a timely fashion.

Where does the problem present itself?

When individuals of the specified groups require long distance travel, they cannot do so efficiently or conveniently. It can be costly to rent a car for endless hours of travel or to pay for a vehicle and its maintenance.

Why does it matter?

Everyone, regardless of status, has a right to easily travel near and far. One should be able to travel throughout the States as they please.
